

# In previous voltammetry studies

Typical voltammogram (current-potential curve) in one glass melt doped with M determined by SWV using Pt crucible

**Nernst Equation:**

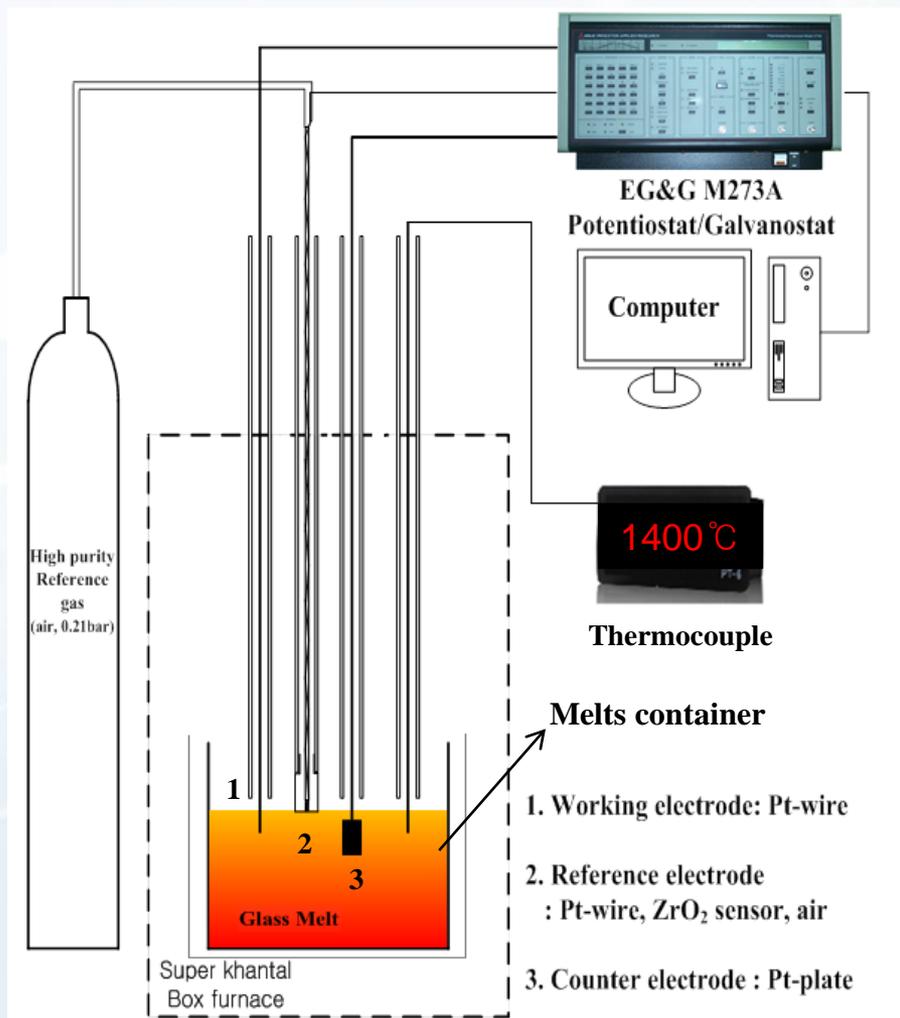

$$\begin{aligned} \text{Redox Ratio} &= \frac{[M^{x+}]}{[M^{(x+n)+}]} \\ &= \frac{1}{P_{O_2}^{n/4}} \exp \left[ \frac{n \cdot F \cdot E_p}{R_g \cdot T} \right] \end{aligned}$$

$P_{O_2}$ : oxygen activity, n: no. of transferred electron  
F: Faraday constant

Instead of real oxygen activity, 0.21bar as  $P_{O_2}$  irrespective of temperature is substituted to determine a redox ratio for M.

Therefore, the actual redox reaction of M in glass melt can not be understood correctly.

# Square Wave Voltammetry

Schematic Diagram of Square Wave Voltammetry Cell

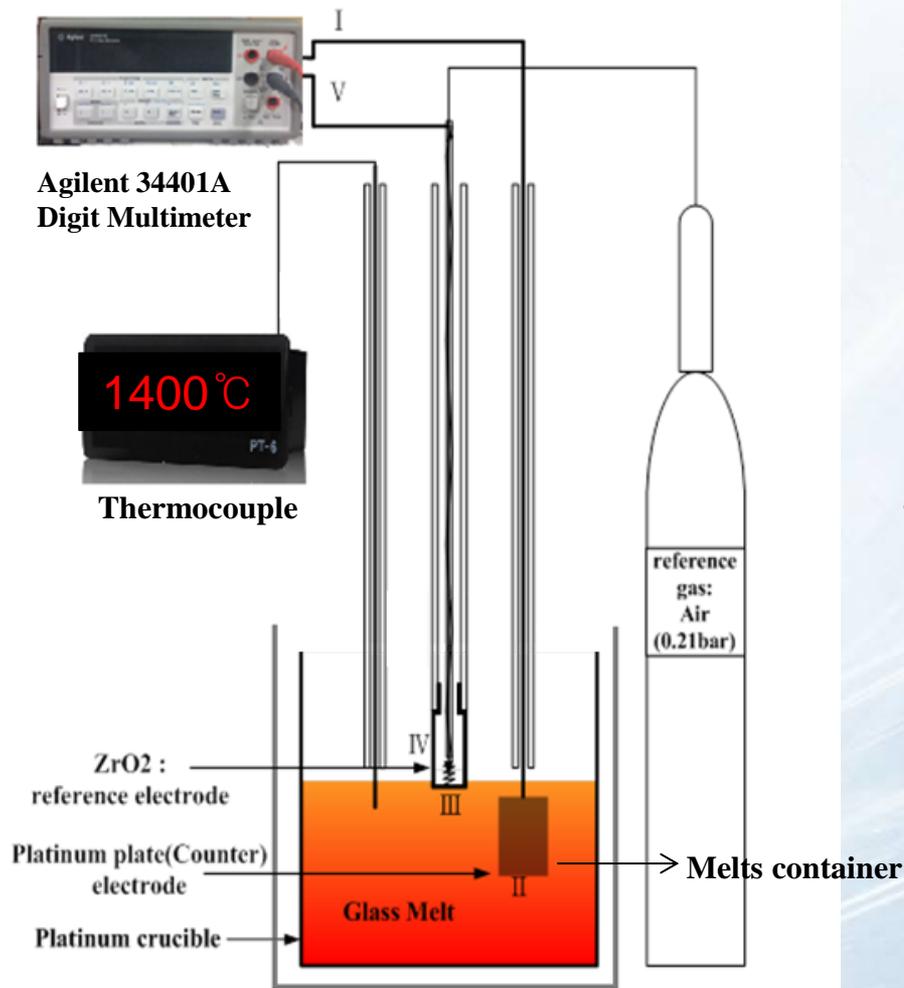

## • Parameters for SWV measurements

- initial potential,  $E_i$  : +200mV
- final potential,  $E_{end}$  : -800mV
- frequency of pulse,  $f$  : 50~500Hz
- height of potential pulse,  $\Delta E_p$  : 0.002V
- step height,  $\Delta E_p$  : 0.1V
- temperature range : 1100°C ~ 1400°C

## • Crucible as melts container

- Platinum alloy (Pt/10Rh)
- Silica glass (GE type 214)
- Sintered alumina

# Oxygen activity

- **Parameters for  $P_{O_2}$  measurements**

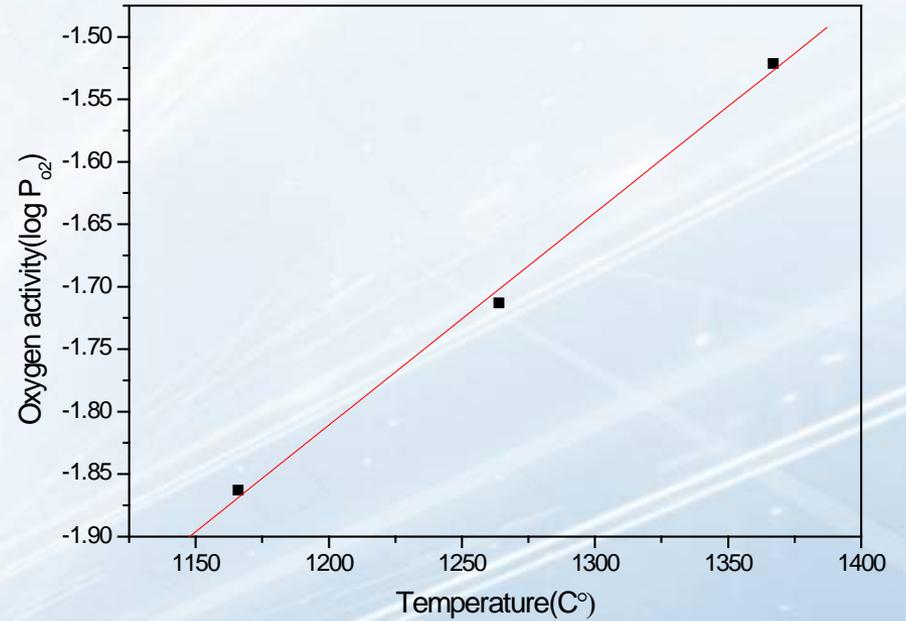

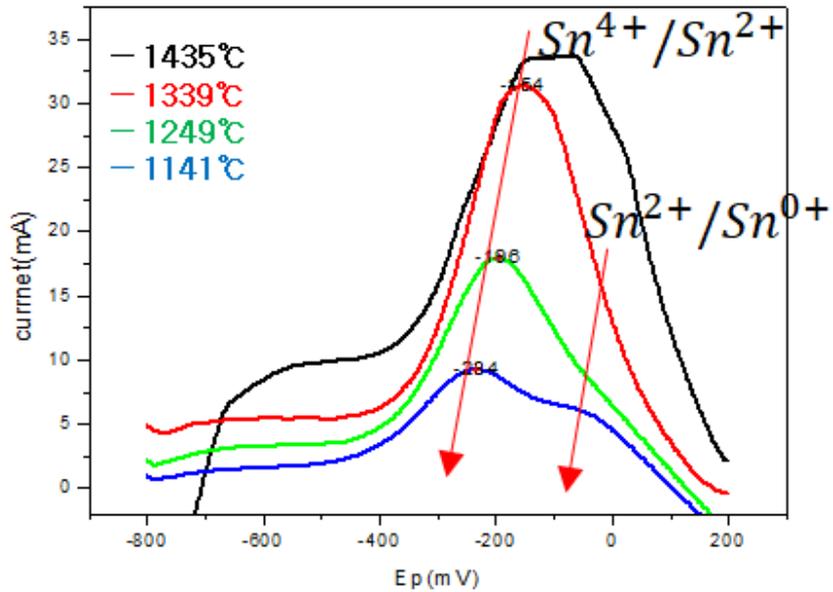

- time interval for measurement : 5 sec
- measurement resolution : 0.00001
- temperature range : 1100°C ~ 1400°C
- time to reach an equilibrium state: 12 hrs

- **Crucible as melts container**

- Silica glass (GE type 214)
- Sintered alumina

**Schematic Diagram for Oxygen Activity Cell  
Oxygen Activity Measurement**

# Voltammogram & Temperature dependence of oxygen activity in alumina crucible

# Redox ratio: $\%[\text{Sn}^{2+}]$
